WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds currently reported as "expansion beds" and beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

WEEK ENDING 28 JANUARY 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated in the chart on page 3, the admission rates from all causes and from all diseases combined decreased slightly for the second successive week, reflecting corresponding decreases in the admission rate from colds, influenza, etc. Nevertheless, for the country as a whole, there has been relatively little change in the morbidity from all causes and from all diseases combined during the four weeks of January. The admission rate from all causes for the week ending 28 January 1944 at 835 per thousand per year and the corresponding all diseases rate of 765 per thousand were both about 15 percent lower than during the corresponding week of 1943.

The admission rate from colds, influenza, etc. for the week ending 28 January 1944 was reported at 332 per thousand or about 5 percent lower than during the preceding three weeks. The current week's morbidity is about 30 percent below the relatively high rate from these causes experienced during the week ending 29 January 1943. Morbidity from all forms of pneumonia increased somewhat to reach about the same level as that which prevailed in the latter part of January 1943.

The admission rate from injury for the week ending 28 January 1944 continued at about 70 per thousand or on the same low level as during the preceding three weeks.

The numbers of new cases of measles, mumps, and scarlet fever reported during the week ending 28 January 1944 were substantially the same as those reported the preceding week (or about 500 cases of measles, and 400 each of mumps and scarlet fever). The number of new cases of meningitis showed an increase, while the number of new cases of rheumatic fever decreased slightly from the high level of the preceding two weeks.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

The Third Service Command was the only one to report a marked increase in morbidity. The Eighth, First, and Sixth Service Commands and the Military District of Washington all reported notably lower morbidity rates. These changes were due chiefly to corresponding changes in the admission rates from colds, influenza, etc.

The highest rate of morbidity from all causes -- in excess of 1100 per thousand -- continued to be reported from the Seventh Service Command which also continued to experience the highest morbidity from colds, influenza, etc. -- in excess of 500 per thousand. The next highest rate of morbidity from all causes -- of about 1075 per thousand -- was that in the Third Service Command, which reported morbidity from colds, influenza, etc. of about 485 per thousand. No other Service Command reported morbidity rates from all causes in excess of 1000 per thousand or from colds, influenza, etc. in excess of 400 per thousand. The lowest morbidity from all causes and from disease was again registered in the First Service Command, which was the only one to report morbidity from colds, influenza, etc. under 250 per thousand.

WEEKLY HEALTH REPORT

WEEK ENDING 28 JANUARY 1944

COMMENT ON CURRENT TRENDS (CONT'D)

The largest numbers of new cases of measles continued in the Fourth and Eighth Service Commands, which together accounted for about two-thirds of the total number of new cases. The largest number of new cases of mumps was again reported from the Fourth Service Command, with the Eighth Service Command being the next highest. The largest number of cases of scarlet fever continued to be reported from the Seventh and Ninth Service Commands. Almost one-half of the new cases of meningitis occurred in the Fourth Service Command. The Seventh Service Command continued to report the largest number of new cases of rheumatic fever.

STATIONS WITH THE HIGHEST MORBIDITY RATES

Among the six stations reporting the highest morbidity from all causes were two where the very high morbidity was mainly due to colds, influenza, etc. (Greensboro AAF, N.C. and Nashville AAC, Tenn.), one where the very high morbidity was largely due to an exceptionally large number of cases of both pneumonia and colds, influenza, etc. (Jefferson Barracks, Mo.), and two where venereal infections existing prior to induction were chiefly responsible (Ft. Benj. Harrison, Ind. and Ft. Sheridan, Ill.). Especially notable are the continued high rates of admission reported from Jefferson Barracks, Mo. for pneumonia, from Camp Hale, Colo. for injuries, and from Camp Shanks, N.Y. for venereal diseases (excluding EPTI).

NON-EFFECTIVE RATE

The mean number of non-effectives for the country as a whole increased only slightly from 40.4 per thousand during the preceding week to 40.5 per thousand for the week ending 28 January 1944.

The differences in the non-effective rates by Service Command do not reflect so much the variations in morbidity in the Service Commands as the varying number of General Hospitals in each Service Command. When comparisons are made between the non-effective rates by Service Command excluding General Hospitals, the difference between the non-effective rates by Service Command are seen to be very much smaller than when the days lost in the General Hospitals are included.

CURRENT HOSPITALIZATION CONDITIONS

The total bed capacity reported as of 28 January 1944 was close to 365,000 or substantially the same as at the end of the preceding week. The number of beds occupied as of 28 January 1944 was about 179,000 or 3,000 less than at the end of the previous week; the number of "available vacant" beds increased to over 114,000. On 28 January there were 32 stations with a bed capacity of about 19,000 which had no "available vacant" beds; included among them were only two general hospitals with a bed capacity of 4,000 beds.

On 28 January 1944 there were 2,186 cases of malaria remaining under treatment, all but 36 of which had presumably been acquired outside of the United States. The number of neuropsychiatric cases remaining at end of the week was reported at 16,061 while the number of tuberculosis cases remaining totaled 1039.
